

Same direction: B catches up and slows down behind A

Pickup to reader loading; optical reading is outside this timeline

B movement details: orange = affected by A; blue = normal acceleration / cruising / stopping

Cost accounting: baseline work $13/15 = 86.7\%$; slowdown penalty $2/15 = 13.3\%$; stopped waiting = 0%.
Illustrative motion model with separate available readers; slowdown penalty is a time difference, not an idle interval.
